

THE WORLD'S FIRST CUTTABLE OPAQUE SPANDREL GLASS AVAILABLE IN ANY COLOUR OR DIGITAL IMAGE

The organic elements used in the manufacturing process form an intermolecularly bonded product that is a unique glass and metal laminate – not a toughened glass.

Chromatics offers an unrivalled depth and consistency of panel colour across the entire RAL spectrum. Any size of digital imagery, textural look, branding or corporate colour requirements can be precisely and durably reproduced – all due to the unique patented Chromatics process.

Chromatics is shatterproof and, even if broken as a result of extreme point impact, the panel will retain its integrity, remaining intact, waterproof and functional until replaced.

Chromatics has a significantly greater resistance to thermal fracture than float glass, is suitable for both exterior and interior applications and is an integral component of monolithic panels, double glazed units, and rainscreen systems.

It is an environmentally considerate product too, being made from renewable resources and requiring much less energy to produce than toughened glass.

For further information on the remarkable new Chromatics process and to request a product sample, contact: **Sales, The Glass Wall Company, Unit N Haydock Cross, Haydock, St Helens WA11 9UX.**
